APRIL 2026 · SHEKAR · PRIORITY: GLANCE-UNCLAIMED

1 · Dashboard

The home screen. Priority job: glance — what's unclaimed this month. Three hierarchies of the same data, from "respect the card groupings" to "forget the cards, show me the urgency."

OPTION A

Card-grouped list

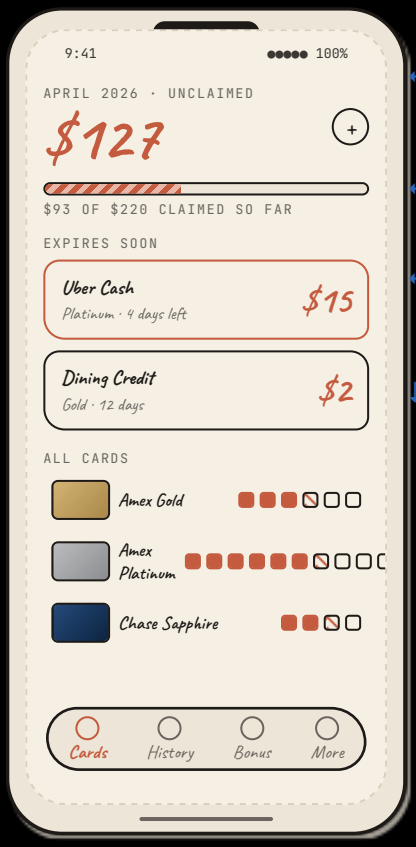
Respects card as the organizing unit

- **Closest to current build.** Familiar wallet metaphor.
- Credits hide under each card — **glance task needs 2 taps**.
- Progress ring per credit. Good for claim-as-you-go.
- Swipe or tap a row to open the **log-a-claim** sheet.

OPTION B

Unclaimed-first queue

Money-left-on-table is hero



- **Optimizes for the priority job.** Unclaimed $ is huge, above the fold.
- "Expires soon" surfaces the burn risk before the card list.
- Card list compresses to a **scorecard row** with segment dots.
- Risk: loses the card-as-container mental model. Partial claims harder to see.

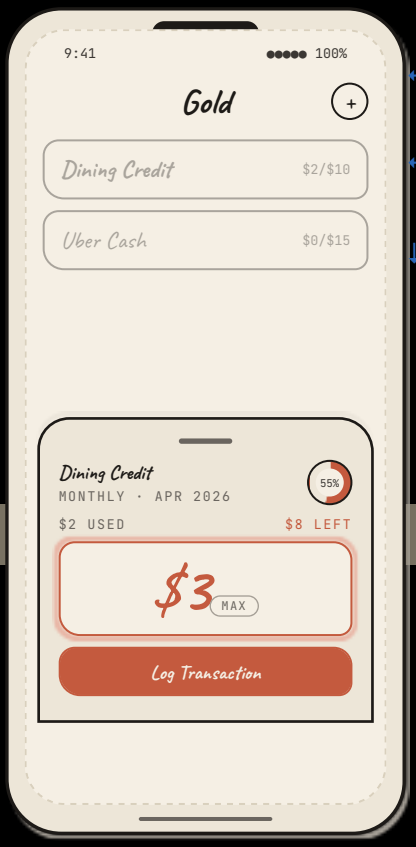
2 · Claim flow

What happens when the user taps a credit to log a use. Range: high-fidelity modal input → gestural shortcut.

OPTION A

Modal sheet + keypad

Detented bottom sheet with preview ring



Closest to current. Big amount input, "Max" chip, ring preview.

Preview ring fills as you type → *satisfying feedback*.

Requires keyboard. Partial claims are accurate but slower.

OPTION B

Quick-amount chips

Tap a preset to log & close

Fastest for full-use cases. "All" chip resolves 80% of claims.

History below = confidence that it's working.

Custom chip falls back to keypad. Less precise for odd amounts.

3 · History + ROI

Answering "am I coming out ahead?" — Net ROI framing, missed-value callouts, and activity recall.

OPTION A

Scorecard + feed

One big number, one chart, chronological log

Matches current app. Net ROI is hero, bar chart shows monthly.

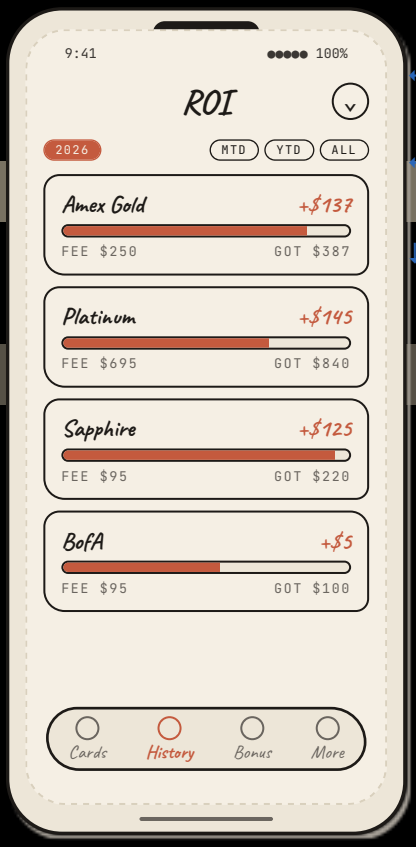
"Money on table" callout — good behavioral nudge.

Feed can get long. Consider filter chips by card.

OPTION B

Per-card scorecards

ROI broken out by card, scannable



Answers "which card is pulling its weight?" in seconds.

Filter chips for MTD / YTD / ALL on top.

Sacrifices chronology — no "when" story.

4 · Bonus tracker (SUBs)

Sign-up bonuses with minimum spend / direct deposit / "other" requirements, a deadline, and account-holder attribution.

OPTION A

Multi-req stack

All requirements visible per card

Closest to current. Shows parallel progress bars per requirement.

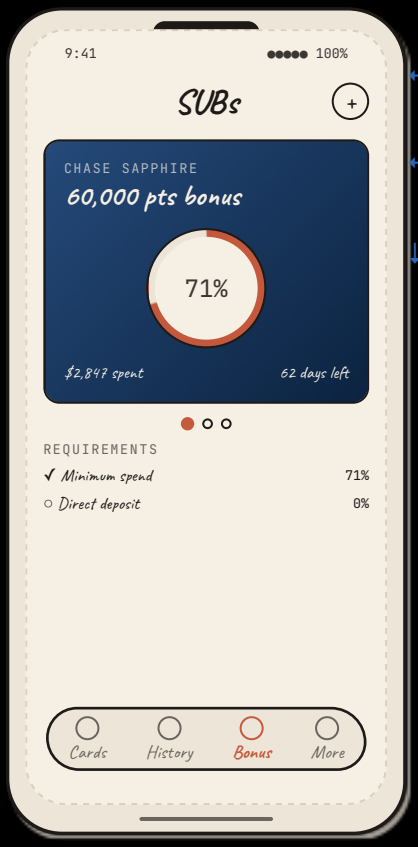
"Days left" pill warns on urgency.

Completed collapses to a single row at bottom.

OPTION B

Card-art hero

One bonus at a time, swipe between



Celebratory. Card gradient is the backdrop.

Single big ring = motivational progress.

Only one bonus visible — worse for portfolio overview.

5 · Add / Edit — Card & Credit

Creation flows for both models. Options range from a utilitarian form to a preview-driven guided flow.

OPTION A

Flat form

Fast, familiar, no surprises

Scan-and-fill. Power-users finish in < 15s.

Swatch strip w/ a custom-color slot.

No preview — user trusts the swatch picker blind.

OPTION B

Live preview card

See the card as you build it

Reduces commitment anxiety. Live gradient preview.

Two-column name+fee layout keeps it compact.

"Next step → credits" nudges a guided two-step flow.

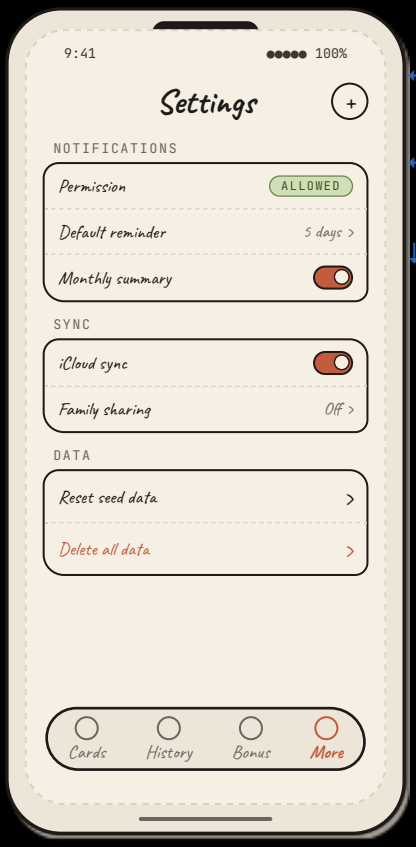
6 · Settings

Notification permissions, sync state, data controls — and how much structure vs. status to show.

OPTION A

Grouped list

Native iOS settings pattern



Safest default. Matches system expectation.

Status pills (ALLOWED, OFF) read fast.

Long list — search becomes useful past ~15 rows.

OPTION B

Status dashboard

'Is everything working?' at a glance

Status-first. Top stats double as identity.

Blocks describe current state, not just navigate to it.

Less dense. Deeper settings need drill-downs.
