APRIL 2026 · SHEKAR · PRIORITY: GLANCE-UNCLAIMED

1 · Dashboard

The home screen. Priority job: glance — what's unclaimed this month. Three hierarchies of the same data, from "respect the card groupings" to "forget the cards, show me the urgency."

OPTION A

Card-grouped list

Respects card as the organizing unit

Closest to current build. Familiar wallet metaphor.

Credits hide under each card — glance task needs 2 taps.

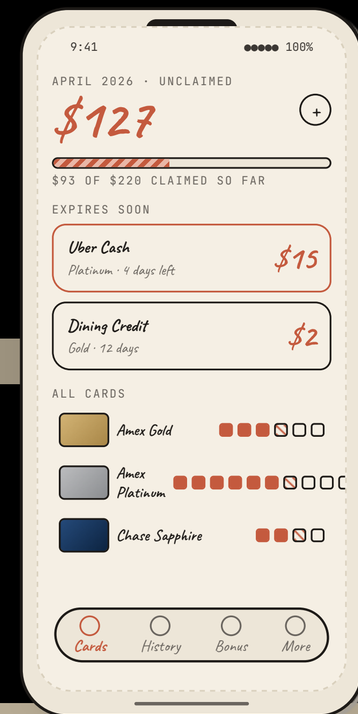
Progress ring per credit. Good for claim-as-you-go.

Swipe or tap a row to open the log-a-claim sheet.

OPTION B

Unclaimed-first queue

Money-left-on-table is hero



Optimizes for the priority job. Unclaimed $ is huge, above the fold.

"Expires soon" surfaces the burn risk before the card list.

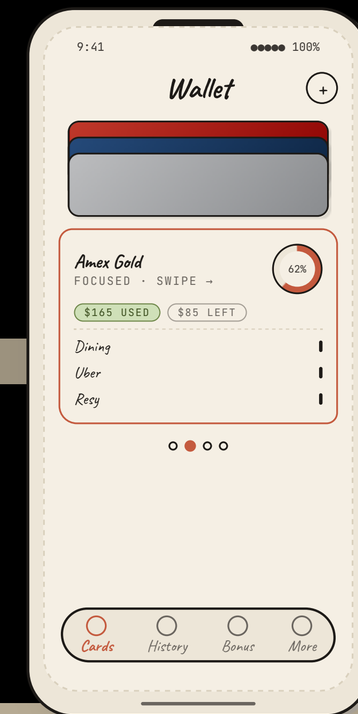
Card list compresses to a scorecard row with segment dots.

Risk: loses the card-as-container mental model. Partial claims harder to see.

OPTION C

Wallet stack + focus

Physical wallet metaphor, one card at a time



Most tactile. Swipe between cards horizontally.

Huge ring = at-a-glance card-level ROI. Bars per credit below.

Tradeoff: only one card visible at a time → worse overview.

Could pair w/ Variant B's summary above the stack.

2 · Claim flow

What happens when the user taps a credit to log a use. Range: high-fidelity modal input → gestural shortcut.

OPTION A

Modal sheet + keypad

Detented bottom sheet with preview ring

Closest to current. Big amount input, "Max" chip, ring preview.

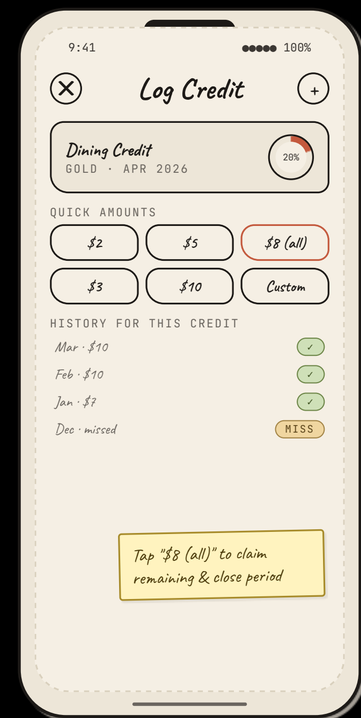
Preview ring fills as you type → *satisfying feedback*.

Requires keyboard. Partial claims are accurate but slower.

OPTION B

Quick-amount chips

Tap a preset to log & close



Fastest for full-use cases. "All" chip resolves 80% of claims.

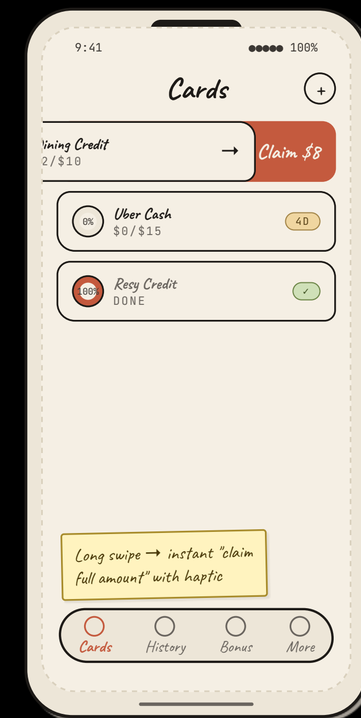
History below = confidence that it's working.

Custom chip falls back to keypad. Less precise for odd amounts.

OPTION C

Swipe-to-claim

No modal; resolve inline



Zero-tap feel. Swipe right = full claim, swipe left = edit.

Haptic on threshold crossing.

Hidden affordance — risky for discovery. Pair w/ coachmark on first launch.

3 · History + ROI

Answering "am I coming out ahead?" — Net ROI framing, missed-value callouts, and activity recall.

OPTION A

Scorecard + feed

One big number, one chart, chronological log

Matches current app. Net ROI is hero, bar chart shows monthly.

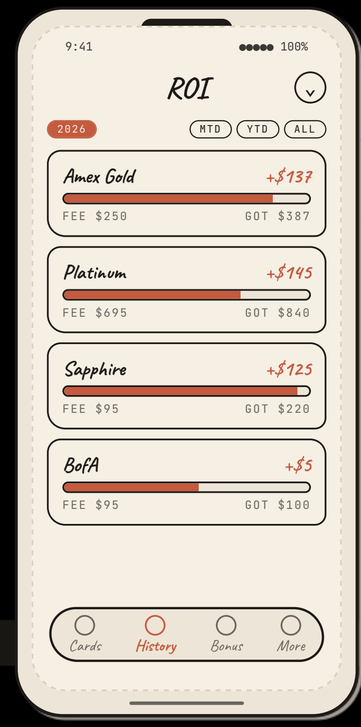
"Money on table" callout — good behavioral nudge.

Feed can get long. Consider filter chips by card.

OPTION B

Per-card scorecards

ROI broken out by card, scannable



Answers "which card is pulling its weight?" in seconds.

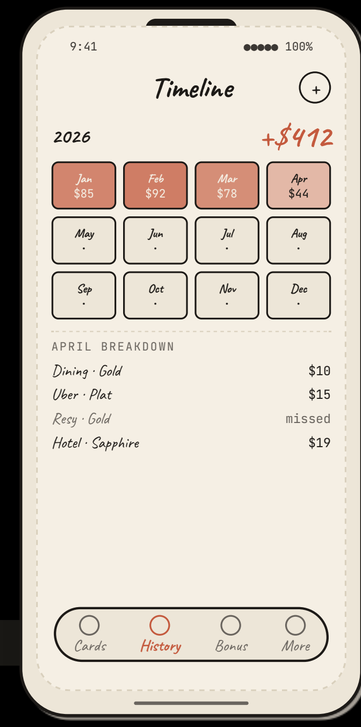
Filter chips for MTD / YTD / ALL on top.

Sacrifices chronology — no "when" story.

OPTION C

Calendar heatmap

Twelve months at a glance



Most visual / rewarding. Momentum is obvious.

Tap a month → breakdown below.

Scales poorly past 1 year. Pair w/ year picker.

4 · Bonus tracker (SUBs)

Sign-up bonuses with minimum spend / direct deposit / "other" requirements, a deadline, and account-holder attribution.

OPTION A

Multi-req stack

All requirements visible per card

Closest to current. Shows parallel progress bars per requirement.

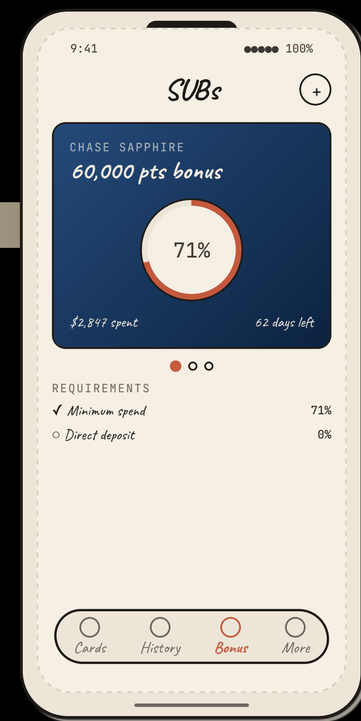
"Days left" pill warns on urgency.

Completed collapses to a single row at bottom.

OPTION B

Card-art hero

One bonus at a time, swipe between



Celebratory. Card gradient is the backdrop.

Single big ring = motivational progress.

Only one bonus visible — worse for portfolio overview.

OPTION C

Deadline timeline

Sorted by urgency, not by card

Urgency-first. Dots mark past/future milestones.

Completed stays in the line = rewarding history.

Mixes req types — a spend SUB next to a points SUB needs careful labeling.

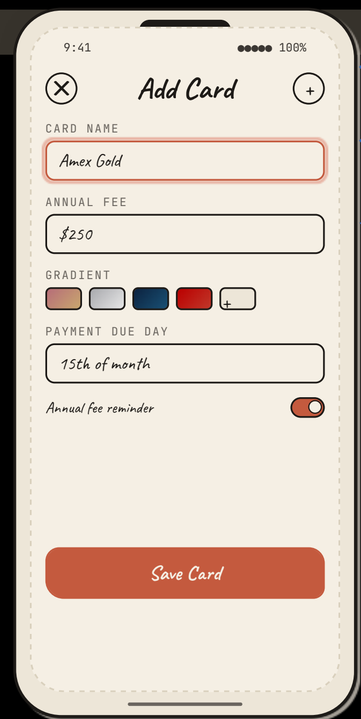
5 · Add / Edit — Card & Credit

Creation flows for both models. Options range from a utilitarian form to a preview-driven guided flow.

OPTION A

Flat form

Fast, familiar, no surprises



Scan-and-fill. Power-users finish in < 15s.

Swatch strip w/ a custom-color slot.

No preview — user trusts the swatch picker blind.

OPTION B

Live preview card

See the card as you build it

Reduces commitment anxiety. Live gradient preview.

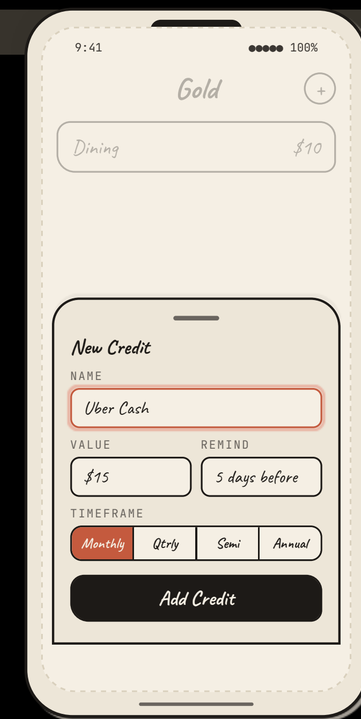
Two-column name+fee layout keeps it compact.

"Next step → credits" nudges a guided two-step flow.

OPTION C

Inline credit sheet

Segmented timeframe, half-sheet over dashboard



Credit-only variant. Half-sheet keeps card context visible.

Segmented control for timeframe beats a picker wheel.

Two inline fields for value + reminder are enough.

6 · Settings

Notification permissions, sync state, data controls — and how much structure vs. status to show.

OPTION A

Grouped list

Native iOS settings pattern

Safest default. Matches system expectation.

Status pills (ALLOWED, OFF) read fast.

Long list — search becomes useful past ~15 rows.

OPTION B

Status dashboard

"Is everything working?" at a glance

Status-first. Top stats double as identity.

Blocks describe current state, not just navigate to it.

Less dense. Deeper settings need drill-downs.

OPTION C

Search-first

Type what you want

Scales well. Good if settings grow (family, planner, widgets…).

"Suggested" replaces grouping with relevance.

First-time users may prefer browsing — keep a "Browse all" link.
